Foreword, by George B. Dantzig	vii
Preface	ix
Acknowledgments	xvi
Glossary of Symbols	xxvii
<b>1 Introduction</b>	<b>3</b>
1.1 Parallel Computers	5
1.1.1 Taxonomy of parallel architectures	6
1.1.2 Unifying concepts of parallel computing	8
1.1.3 Control and data parallelism	10
1.2 How Does Parallelism Affect Computing?	13
1.3 A Classification of Parallel Algorithms	15
1.3.1 Parallelism due to algorithm structure: Iterative projection algorithms	15
1.3.2 Parallelism due to problem structure: Model decomposition and interior point algorithms	19
1.4 Measuring the Performance of Parallel Algorithms	22
1.5 Notes and References	24
<b>PART I THEORY</b>	
<b>2 Generalized Distances and Generalized Projections</b>	<b>29</b>
2.1 Bregman Functions and Generalized Projections	30
2.2 Generalized Projections onto Hyperplanes	35
2.3 Bregman Functions on the Whole Space	38
2.4 Characterization of Generalized Projections	42
2.5 Csiszár $\varphi$ -divergences	45
2.6 Notes and References	47
<b>3 Proximal Minimization with <math>D</math>-Functions</b>	<b>49</b>
3.1 The Proximal Minimization Algorithm	50
3.2 Convergence Analysis of the PMD Algorithm	51
3.3 Special Cases: Quadratic and Entropic PMD	57
3.4 Notes and References	57

<b>4</b>	<b>Penalty Methods, Barrier Methods and Augmented Lagrangians</b>	<b>60</b>
4.1	Penalty Methods	60
4.2	Barrier Methods	63
4.3	The Primal-Dual Algorithmic Scheme	65
4.4	Augmented Lagrangian Methods	68
4.5	Notes and References	74
<b>PART II ALGORITHMS</b>		
<b>5</b>	<b>Iterative Methods for Convex Feasibility Problems</b>	<b>79</b>
5.1	Preliminaries: Control Sequences and Relaxation Parameters	80
5.2	The Method of Successive Orthogonal Projections	81
5.3	The Cyclic Subgradient Projections Method	83
5.4	The Relationship of CSP to Other Methods	87
5.4.1	The method of successive orthogonal projections	87
5.4.2	A remotest set controlled subgradient projections method	88
5.4.3	The scheme of Oettli	88
5.4.4	The linear feasibility problem: solving linear inequalities	89
5.4.5	Kaczmarz's algorithm for systems of linear equations and its nonlinear extension	90
5.5	The $(\delta, \eta)$ -Algorithm	92
5.6	The Block-Iterative Projections Algorithm	100
5.6.1	Convergence of the BIP algorithm	102
5.7	The Block-Iterative $(\delta, \eta)$ -Algorithm	106
5.8	The Method of Successive Generalized Projections	107
5.9	The Multiprojections Algorithm	110
5.9.1	The product space setup	110
5.9.2	Generalized projections in the product space	112
5.9.3	The simultaneous multiprojections algorithm and the split feasibility problem	113
5.10	Automatic Relaxation for Linear Interval Feasibility Problems	116
5.11	Notes and References	122

<b>6</b>	<b>Iterative Algorithms for Linearly Constrained Optimization Problems</b>	127
6.1	The Problem, Solution Concepts, and the Special Environment	128
6.1.1	The problem	128
6.1.2	Approaches and solution concepts	128
6.1.3	The special computational environment	131
6.2	Row-Action Methods	131
6.3	Bregman's Algorithm for Inequality Constrained Problems	133
6.4	Algorithm for Interval-Constrained Problems	142
6.5	Row-Action Algorithms for Norm Minimization	147
6.5.1	The algorithm of Kaczmarz	147
6.5.2	The algorithm of Hildreth	148
6.5.3	ART4 – An algorithm for norm minimization over linear intervals	150
6.6	Row-Action Algorithms for Shannon's Entropy Optimization	152
6.7	Block-Iterative MART Algorithm	154
6.8	Underrelaxation Parameters and Extension of the Family of Bregman Functions	160
6.9	The Hybrid Algorithm: A Computational Simplification	172
6.9.1	Hybrid algorithms for Shannon's entropy	176
6.9.2	Algorithms for the Burg entropy function	178
6.9.3	Rényi's entropy function	184
6.10	Notes and References	186
<b>7</b>	<b>Model Decomposition Algorithms</b>	190
7.1	General Framework of Model Decompositions	191
7.1.1	Problem modifiers	192
7.1.2	Solution algorithms	195
7.2	The Linear-Quadratic Penalty (LQP) Algorithm	201
7.2.1	Analysis of the $\epsilon$ -smoothed linear-quadratic penalty function	204
7.2.2	$\epsilon$ -exactness properties of the LQP function	209
7.3	Notes and References	213
<b>8</b>	<b>Decompositions in Interior Point Algorithms</b>	217
8.1	The Primal-Dual Path Following Algorithm for Linear Programming	218
8.1.1	Choosing the step lengths	222

8.1.2	Choosing the barrier parameter	222
8.2	The Primal-Dual Path Following Algorithm for Quadratic Programming	223
8.3	Parallel Matrix Factorization Procedures for the Interior Point Algorithm	227
8.3.1	The matrix factorization procedure for the dual step direction calculation	228
8.4	Notes and References	232
<b>PART III APPLICATIONS</b>		
<b>9</b>	<b>Matrix Estimation Problems</b>	<b>237</b>
9.1	Applications of Matrix Balancing	238
9.1.1	Economics: social accounting matrices (SAMs)	238
9.1.2	Transportation: estimating Origin-Destination Matrices	239
9.1.3	Statistics: estimating contingency tables	241
9.1.4	Demography: modeling interregional migration	241
9.1.5	Stochastic modeling: estimating transition probabilities	242
9.2	Mathematical Models for Matrix Balancing	243
9.2.1	Matrix estimation formulations	244
9.2.2	Network structure of matrix balancing problems	246
9.2.3	Entropy optimization models for matrix balancing	248
9.3	Iterative Algorithms for Matrix Balancing	250
9.3.1	The range-RAS algorithm (RRAS)	250
9.3.2	The RAS scaling algorithm	254
9.3.3	The range-DSS algorithm (RDSS)	255
9.3.4	The diagonal similarity scaling (DSS) algorithm	258
9.4	Notes and References	259
<b>10</b>	<b>Image Reconstruction from Projections</b>	<b>262</b>
10.1	Transform Methods and the Fully Discretized Model	264
10.2	A Fully Discretized Model for Positron Emission Tomography	272
10.2.1	The expectation-maximization algorithm	275
10.3	A Justification for Entropy Maximization in Image	

Reconstruction	277
10.4 Algebraic Reconstruction Technique (ART) for Systems of Equations	280
10.5 Iterative Data Refinement in Image Reconstruction	283
10.5.1 The fundamentals of iterative data refinement	283
10.5.2 Applications in medical imaging	292
10.6 On the Selective Use of Iterative Algorithms for Inversion Problems	299
10.7 Notes and References	301
<b>11 The Inverse Problem in Radiation Therapy Treatment Planning</b>	306
11.1 Problem Definition and the Continuous Model	308
11.1.1 The continuous forward problem	309
11.1.2 The continuous inverse problem	311
11.2 Discretization of the Feasibility Problem	312
11.3 Computational Inversion of the Data	317
11.4 Consequences and Limitations	319
11.5 Experimental Results	320
11.6 Combination of Plans in Radiotherapy	328
11.6.1 Basic definitions and mathematical modeling	328
11.6.2 The feasible case	330
11.6.3 The infeasible case	333
11.7 Notes and References	338
<b>12 Multicommodity Network Flow Problems</b>	341
12.1 Preliminaries	342
12.2 Problem Formulations	343
12.2.1 Transportation problems	344
12.2.2 Multicommodity network flow problems	346
12.3 Sample Applications	349
12.3.1 Example one: Covering positions in stock options	349
12.3.2 Example two: Air-traffic control	350
12.3.3 Example three: Routing of traffic	351
12.4 Iterative Algorithms for Multicommodity Network Flow Problems	352
12.4.1 Row-action algorithm for quadratic transportation problems	352
12.4.2 Extensions to generalized networks	356
12.4.3 Row-action algorithm for quadratic	

multicommodity transportation problems	361
12.5 A Model Decomposition Algorithm for Multicommodity Network Flow Problems	365
12.5.1 The linear-quadratic penalty (LQP) algorithm	365
12.6 Notes and References	367
<b>13 Planning Under Uncertainty</b>	<b>371</b>
13.1 Preliminaries	372
13.2 The Newsboy Problem	373
13.3 Stochastic Programming Problems	374
13.3.1 Anticipative models	375
13.3.2 Adaptive models	375
13.3.3 Recourse models	376
13.4 Robust Optimization Problems	381
13.5 Applications	384
13.5.1 Robust optimization for the diet problem	384
13.5.2 Robust optimization for planning capacity expansion	385
13.5.3 Robust optimization for matrix balancing	391
13.6 Stochastic Programming for Portfolio Management	394
13.6.1 Notation	396
13.6.2 Model formulation	398
13.7 Stochastic Network Models	400
13.7.1 Split-variable formulation of stochastic network models	402
13.7.2 Component-wise representation of the stochastic network problem	404
13.8 Iterative Algorithm for Stochastic Network Optimization	405
13.9 Notes and References	413
<b>14 Decompositions for Parallel Computing</b>	<b>417</b>
14.1 Vector-Random Access Machine (V-RAM)	418
14.1.1 Parallel prefix operations	419
14.2 Mapping Data to Processors	420
14.2.1 Mapping a dense matrix	420
14.2.2 Mapping a sparse matrix	421
14.3 Parallel Computing for Matrix Balancing	424
14.3.1 Data parallel computing with RAS	425
14.3.2 Control parallel computing with RAS	427
14.4 Parallel Computing for Image Reconstruction	428

14.4.1	Parallelism within a block	430
14.4.2	Parallelism with independent blocks	431
14.4.3	Parallelism between views	432
14.5	Parallel Computing for Network-structured Problems	433
14.5.1	Solving dense transportation problems	434
14.5.2	Solving sparse transportation problems	435
14.5.3	Solving sparse transshipment graphs	437
14.5.4	Solving network-structured problems	438
14.6	Parallel Computing with Interior Point Algorithms	438
14.6.1	The communication schemes on a hypercube	439
14.6.2	The parallel implementation on a hypercube	441
14.6.3	An alternative parallel implementation	442
14.7	Notes and References	443
<b>15</b>	<b>Numerical Investigations</b>	445
15.1	Reporting Computational Experiments on Parallel Machines	447
15.2	Matrix Balancing	448
15.2.1	Data parallel implementations	449
15.2.2	Control parallel implementations	450
15.3	Image Reconstruction	452
15.4	Multicommodity Network Flows	454
15.4.1	Row-action algorithm for transportation problems	455
15.4.2	Row-action algorithm for multicommodity transportation problems	458
15.4.3	Linear-quadratic penalty (LQP) algorithm for multicommodity network flow problems	459
15.5	Planning Under Uncertainty	461
15.5.1	Interior point algorithm	461
15.5.2	Row-action algorithm for nonlinear stochastic networks	466
15.6	Proximal Minimization with $D$ -functions	469
15.6.1	Solving linear network problems	470
15.6.2	Solving linear stochastic network problems	472
15.7	Description of Parallel Machines	476
15.7.1	Alliant FX/8	476
15.7.2	Connection Machine CM-2	477
15.7.3	Connection Machine CM-5	477
15.7.4	CRAY X-MP and Y-MP	477
15.7.5	Intel iPSC/860	477

15.8 Notes and References	478
Bibliography	481
